XAVAULT

V1 Product Hardening Plan and V2 Roadmap

A practical execution document for tightening deposits, withdrawals, subscriptions, notifications, security, analytics, habit loops, and user experience before scaling.

Core V1 principle: every money movement must be clear, recoverable, secure, and easy to understand.

Document Area	Purpose
V1 Hardening	Make current flows safe, reliable, observable, and polished.
V1 Engagement	Help users build habits without making finance feel childish.
V2 Roadmap	Defer bigger bets until real usage data shows where demand exists.

Executive Summary

What V1 must prove before growth

V1 should focus on trust and clarity, not feature sprawl. Users must always understand where money is, what state a payment is in, and what action they should take next.

- Deposits must survive Paystack redirects, app backgrounding, and app restarts.
- Withdrawals must have review, confirmation, status, and safe cancellation behavior.
- Subscription prompts must be useful and respectful, never noisy.
- Push tokens, notification preferences, and in-app notifications must be production-ready.
- Analytics must capture drop-offs before V2 decisions are made.
- Gamification should reinforce useful money habits, not pressure users.

V2 should begin only after enough active users reveal which flows produce retention, confusion, or re

V1 Priority Stack

Recommended execution order

Priority	Workstream	Why it comes first
1	Compile, route, and auth stability	Broken navigation and auth recovery block everything else.
2	Deposit verification and receipts	Deposits are the first trust moment in the product.
3	Withdrawal safety and status	Withdrawals carry the highest user anxiety and support risk.
4	Push token and notification center	Users need reliable status updates after money events.
5	Plan and envelope clarity	Users need to understand locked, flexible, allocated, and unboxed money.
6	Analytics and event tracking	V2 should be based on observed behavior, not guesses.
7	Light gamification	Habit loops matter after the core money flows are trustworthy.
8	UI polish and motion	Motion should make state changes clearer, not decorate c

Deposit Flow Hardening

Make every deposit recoverable and explainable

Deposits should be treated as a multi-state transaction, not a single button press. The app must persist pending deposits before leaving for Paystack and verify them when the user returns.

- Persist pending deposit reference, amount, and initiated time before opening Paystack.
- Verify pending deposit on app foreground and cold start.
- Show Processing, Confirmed, Still Processing, Failed, and Abandoned states.
- Refresh wallet, ledger, and deposit history after successful verification.
- Add Retry Verification button for deposits that stay pending.
- Keep deposit modal open when initiation fails.
- Show deposit reference and transaction receipt after success.
- Add minimum and maximum amount validation.
- Restore dedicated bank transfer account UI with copy account number action.
- Add I Have Made Transfer action to refresh wallet and ledger.
- Prevent duplicate submits with an idempotency key.
- Track deposit_started, checkout_opened, verified, failed, abandoned.

State	User Message	Primary Action
initiated	Deposit started. Complete payment in checkout.	Open checkout
verifying	Checking your payment status.	Wait
confirmed	Deposit confirmed. Wallet refreshed.	View receipt
still_processing	Payment is still processing.	Retry verification
failed	Deposit could not be confirmed.	Try again
abandoned	Checkout was not completed.	Start a new deposit

Withdrawal Flow Hardening

Reduce mistakes and support burden

Withdrawal is the highest-risk flow. The user should always know source, destination, amount, fees if any, reference, and finality before the request is submitted.

- Add a final review screen before submitting a withdrawal.
- Show source clearly: plan unboxed, envelope unboxed, matured locked balance, or flexible balance.
- Explain why locked funds are unavailable.
- Require confirmation before discarding a started withdrawal.
- Prevent closing while withdrawal is processing.
- Show withdrawal reference and receipt after success.
- Track requested, processing, paid, failed, reversed states.
- Refresh wallet, plans, envelopes, and ledger after request.
- Disable CTA until account resolution, amount, and PIN are valid.
- Add daily/monthly limits if backend supports them.
- Use idempotency key for retry safety.
- Add support copy: withdrawals are irreversible once submitted.

Review Field	Required Content
From	Plan or envelope name plus source type
To	Bank name, masked account number, resolved account name
Amount	Exact amount in NGN
Timing	Expected processing message
Reference	Available after request is accepted
Risk Copy	Withdrawal cannot be reversed once submitted

Security and Payment PIN

Make sensitive actions feel protected

- Prompt users to create payment PIN at first withdrawal attempt.
- Block weak PINs such as 0000, 1111, 1234, and birth-year patterns where possible.
- Add cooldown after repeated wrong PIN attempts.
- Allow biometric confirmation as an optional layer before withdrawal.
- Keep PIN reset as a clear OTP plus new PIN flow.
- Use haptic feedback for PIN entry, success, and error states.
- Separate login security and payment authorization in UI copy.

Subscription and Upgrade Flow

Respectful monetization

- Never show upgrade prompts to active paid users.
- Use reminder suppression and randomized backoff after skip.
- Do not show upgrade prompts during deposit, withdrawal, or form submission.
- Manual upgrade buttons should bypass suppression.
- Show the blocked feature or reached limit inside the prompt.
- Persist pending subscription verification before Paystack checkout.
- Clear reminder state after successful subscription verification.
- Show active plan, next renewal or expiry, and plan benefits in profile.

Push Notifications

Device token, preferences, deep links, and notification center

Notifications should be requested after a value moment, not immediately on install. The app should ask when the user understands why notifications matter.

- Ask permission after first plan, first deposit, first envelope, or first withdrawal setup.
- Register push token with backend including platform, app version, device ID, and permission status.
- Update token on app start if it changes.
- Delete or invalidate token on logout.
- Handle notification tap deep links for deposit, withdrawal, plan maturity, subscription, and reminders.
- Add notification preferences for deposits, withdrawals, plans, subscription, reminders, and product updates.
- Add in-app notification center because the bell already exists.
- Show unread count and mark-as-read behavior.
- Use in-app banners for important status events when app is foregrounded.

Notification	Deep Link	Priority
Deposit confirmed	Wallet transaction detail	High
Withdrawal status changed	Withdrawal receipt or transaction detail	High
Plan maturity reached	Plan detail	Medium
Envelope reminder	Envelope detail	Medium
Subscription verified	Subscription/profile	Medium
Weekly recap	Home recap card	Low

Home Screen UX

Make the next action obvious

- Add a Next Action card at the top of home.
- Show wallet as Available, Locked, and Total/Ledger balance.
- Make recent movements tappable with transaction detail screens.
- Add pull-to-refresh.
- Show pending deposit or subscription verification card when relevant.
- Replace plain empty states with action-oriented cards.
- Use skeleton loading for wallet, plans, and ledger.
- Make notification bell open the in-app notification center.

Next Action Condition	Suggested CTA
No payment PIN	Set payment PIN
No plan	Create first plan
Draft plan exists	Finish and confirm plan
No envelopes in draft	Add first envelope
Pending deposit	Check deposit status
Available unboxed balance	Allocate to envelope

Plans and Envelopes UX

Make locked money understandable

- Add plan creation review before submit.
- Show a draft guide: create plan, add envelopes, confirm plan.
- Explain target amount, allocated amount, unboxed balance, locked balance, and flexible balance.
- Add plan timeline and maturity countdown.
- Animate progress bars when funding changes.
- Add Fund This Plan CTA where relevant.
- Add Move Unboxed Money To Envelope CTA.
- Add Why Can I Not Confirm checklist.
- Add edit and cancel actions with confirmation.
- Show available-to-withdraw summary on plan and envelope screens.

Error Handling and Recovery

No dead ends

- Create one central getApiErrorMessage helper.
- Use toast for lightweight errors and modals for destructive or payment errors.
- Handle offline network errors differently from backend validation errors.
- Show Still Processing for ambiguous payment states instead of hard failure.
- Keep forms open after failed submissions.
- Clear pending records only after success, expiry, or explicit user dismissal.
- Attach backend trace ID or reference to support-facing receipts if available.

Analytics and Observability

Measure before V2

V2 should be based on measured behavior. Add event tracking before heavy growth so product decisions are grounded in real funnels.

Funnel	Events to Track
Authentication	signup_started, email_verified, signup_completed, login_success, logout
Deposit	deposit_opened, amount_entered, checkout_opened, verified, failed, abandoned
Withdrawal	withdrawal_opened, source_selected, destination_selected, pin_entered, completed, failed, abandoned
Plans	plan_created, envelope_created, plan_previewed, plan_confirmed, plan_cancelled
Subscription	prompt_shown, prompt_skipped, payment_started, verified, expired
Notifications	permission_requested, granted, denied, token_registered, notification_opened

- Track app version and platform on all events.
- Track route/screen name for key events.
- Avoid storing sensitive financial values in analytics unless explicitly needed and protected.
- Review weekly funnel drop-offs before prioritizing V2.

V1 Gamification

Useful habit loops without making finance feel childish

- Vault Health score based on active plans, emergency readiness, completed plans, and withdrawal discipline.
- Plan milestones at 25, 50, 75, and 100 percent funded.
- Small celebration animation and haptics on milestone completion.
- Badges for First Plan, First Envelope, First Deposit, Fully Funded, Plan Completed, Salary Splitter.
- Weekly recap: You protected NGN X this week.
- Gentle streaks for weekly saving, not daily pressure.
- No shame states when a streak breaks.
- Challenges should be opt-in or context-aware.

Design rule: gamification should make progress visible, not make the user feel punished.

UI and Motion Guidelines

Modern but calm

- Standardize buttons, modals, bottom sheets, cards, empty states, and loading states.
- Use icon buttons for common actions and clear text buttons for major commands.
- Add bottom sheet entrance animations.
- Animate progress bars and success states.
- Use haptics for success, error, PIN input, and milestone moments.
- Fix broken glyphs and encoding issues in copy.
- Add accessibility labels for icon-only controls.
- Avoid interrupting sensitive money flows with marketing prompts.

V1 Definition of Done

Release checklist before pushing growth

Area	Done When
Deposit	Pending deposit survives return, restart, retry, and refresh.
Withdrawal	Review, discard guard, receipt, and status refresh are complete.
Subscription	Global verification and respectful reminder logic are complete.
Notifications	Push token, preferences, deep links, and notification center exist.
Plans	Users understand draft, confirmation, allocation, and locked states.
Analytics	Core funnels are tracked and reviewed weekly.
UI	No broken glyphs, no dead empty states, no unclear loading states.
Quality	Typecheck and lint pass before every release.

V2 Roadmap

Build after real user data

V2 should start only after V1 has enough users and funnel data. The purpose of V2 is to expand what works, not guess at what might work.

Theme	Possible V2 Features
Automation	Recurring deposits, salary split automation, auto-envelope funding, rules engine.
Intelligence	Smart saving recommendations, budget coach, personalized next actions, risk alerts.
Social	Shared envelopes, family vaults, group savings, accountability circles.
Growth	Referral program, rewards, premium trials, lifecycle campaigns.
Financial Depth	Advanced analytics, credit readiness, bill reminders, multi-currency support.
Platforms	Web dashboard, admin/support console, exports, richer receipts.

- Promote features from V2 only when analytics show demand or friction.
- Prioritize the V2 feature that improves retention or revenue with the least operational risk.
- Avoid social or credit features until trust, support, and compliance are mature.

Post-V1 Decision Gates

When to move into V2

Question	Signal Needed
Are users depositing successfully?	High deposit completion and low support tickets.
Are users creating plans?	Strong first-plan and first-envelope conversion.
Do users return?	Healthy week-1 and month-1 retention.
Does subscription convert?	Prompt-to-payment and payment-to-active rates are healthy.
Where do users struggle?	Clear funnel drop-off data and support themes.
What do users ask for?	Repeated requests from active users, not one-off ideas.
